

Basic Radar Chart

A radar chart displays the value of several numerical variables for one or several entities. Here is an example of a simple one, displaying the values of 5 variables for only one individual.

To my knowledge, there is no built in function allowing to make radar charts with Matplotlib. Thus, we have to use basic functions to build it, what makes it a bit fastidious.

Check out <https://python-graph-gallery.com/> for more wonderful examples of plots in Python.
